

PERMISSION FIREWALL FOR AI AGENTS

OneLinkPay

Give your AI a card.
Not your wallet.

On-chain limits · instant revoke · a proof receipt per charge

THE MISSING SAFETY LAYER

Autonomous software needs a card, not a key.

Full-wallet authority is too dangerous. Per-action approval removes the point of automation.

FULL WALLET ACCESS

Unlimited authority

One bug, malicious prompt, or compromised tool can reach everything.

No safe boundary

ONELINK MANDATE

Bounded permission

One merchant. Per-charge, daily, and total caps.
Expiry. Instant revoke.

The user keeps the kill switch

The wallet stays yours. Only the permission is delegated.

LIVE USE CASE

The task finished. The overspend didn't.

A deterministic research workflow bought what it needed, produced the brief, and hit a hard on-chain boundary.

The task finished. The overspend didn't.

Inspect the verified mainnet outcome without signing or spending: a deterministic workflow bought the two inputs needed for an ETH risk brief. Then an injected test instruction requested an unnecessary export, and the signed card contained it before settlement.

✓ No wallet needed

No transaction sent by replay

Real Arbitrum evidence

Research Agent Expense Card

✓ Verified replay

The resource payloads and brief are deterministic demo fixtures. The two USDC settlements and revoke are mined mainnet evidence from the verified live run. The adversarial instruction is a deterministic fixture, not LLM reasoning; its refusal was observed live during preflight against the deployed policy and can be reproduced below.

MISSION	SIGNED BOUNDARY	DAILY BUDGET
Prepare an ETH risk brief	0.10 USDC / tool	2.00 USDC

📄 Outcome

✓ Task complete - policy held

Task completed safely

Software bought 2 required inputs, produced the brief, and could not move funds for the unexpected

USEFUL SPEND

0.13 USDC

2 required inputs

BLOCKED REQUEST

0.20 USDC

over 0.10 cap

BUDGET LEFT

1.87 USDC

still controlled

Useful work completed. Unexpected spend produced no transaction.

HUMAN-READABLE CONSENT

The mandate is the product.

One signature turns a Universal Account into a revocable expense card for one job.

RESEARCH EXPENSE CARD

ARMED

Prepare an ETH market-risk brief

Per paid tool

up to 0.10 USDC

Daily budget

2.00 USDC

Provider

one approved address

Permission

expires · revocable

0.20 USDC premium request will be rejected

The workflow never receives unrestricted wallet authority.

EXECUTION AND VERIFICATION

Particle moves value. OneLink verifies before arming.

The user sees one action; the system checks every on-chain leg before the budget becomes spendable.

PUBLIC PROOF

Every claim opens in a public explorer.

Payment, route, policy enforcement, and revoke can be checked without trusting our UI.

Useful work done. Overspend impossible. Proof public.

Verify it yourself

-  **Particle Explorer**
one FINISHED cross-chain activity
-  **BaseScan and Arbiscan**
source, approval, purchases, revoke
-  **OneLink Proof Receipt**
invoice and settlement bound together
